WZ Reader

Every document, fast and simple — User Guide

📂 Opening files

PDF, HWP, Word, PowerPoint, Excel, mail, Markdown and images

Formats: **PDF** · **HWP** (.hwp .hwpx) · **Word** (.docx) · **PowerPoint** (.pptx) · **Excel** (.xlsx .xls .ods .csv) · **mail** (.eml) · **Markdown** (.md) · **images** (jpg png gif bmp webp tiff). No Office or Hancom Office needed.

🖱️ Click 📂 **Open** on the left rail, or press `F2`.

🗂️ **Drag and drop** a file onto the window.

🕘 Reopen one from **Recent files** on the start screen. *(desktop app)*

📁 **Double-click a file** in Windows Explorer and it opens in WZ Reader. *(installed version)*

🔗 Use 📂 **Open** → **Open from URL** and paste a link to a document on the web. *(If the site blocks cross-origin access, download the file and open it.)*

> 🔐 A **password-protected PDF** asks for its password when it opens. See Passwords.

> 🖼️ **Open a picture and the rest of its folder comes with it** in the page list — page through them as you would a PDF. Pick or drop several at once, or open a ZIP of pictures, and they become one document; **Save as PDF** puts them all in one PDF. Multi-page TIFF, transparent PNG and animated GIF show as they are.

> 🐘 **PDFs over 500 MB** open too (up to about 2 GB): only the parts in view are read, so they open quickly — view only. *(desktop app)*

View modes

Switch the layout to match what you are doing

🧭 **Where things are:** the tools are on the **left rail**; the file name, page number and zoom are in the **title bar** at the top. Hover an icon for its name; in a short window some move into the ⋮ menu. On a phone the tools are along the bottom.

Pick one from the **Page layout** button on the left rail.

Single page

Scroll one page at a time, top to bottom. The default.

Two-page spread

Two pages side by side, like a book. A wide page gets a row of its own.

Grid view

Every page at a glance. Click one to jump to it.

Fullscreen

Fill the whole screen — made for talks and presentations.

💡 **Zoom:** `Ctrl` + mouse wheel (around the pointer), or **+** / **–** in the title bar. **Fit width** beside them makes the text bigger and sharper.

⌨️ **Command search:** press `Ctrl` + `K` and type what you want to do (save, rotate, print…). Every feature, straight from the keyboard.

📑 **Outline:** a PDF with bookmarks gets an **Outline** tab in the page panel. Click to jump; filter it from the box at the top.

🌙 **Appearance:** the **Appearance** menu on the left rail has a dark theme and reading colours (sepia, night). The file is not changed.

🔎 **Find:** 🔍 on the left rail or `Ctrl` + `F` searches the document, in every format. It starts from the page you are on, has **Aa** (match case) and **ab** (whole words), and a list of every result with its context.

🎬 **Fullscreen:** `F5` starts from the first page, `Alt` + `F5` from the page you are on.

Word · PowerPoint · Excel

As they were written — tables, charts and pictures, without Office

Word

Pages break where Word breaks them, with headers, footers and bullets.

PowerPoint

Slides look as they do in PowerPoint. Hidden slides are skipped in the slideshow.

Excel

Fonts, colours, borders, merged cells and number formats as written. **Every row** of a sheet with 200,000+ rows.

Word and PowerPoint get the same **single · two-page · grid** layouts, page counter and page list as a PDF.

Speaker notes

A deck with notes shows them in a yellow box under each slide. Toggle them with the notes button on the left rail.

Slideshow captions

In the fullscreen slideshow the notes run along the bottom as **captions**. `C` or the corner button turns them off.

Narrated video

A deck with notes saves as an MP4 with the **film button**: the notes read aloud, with subtitles a player can switch on and off. *(desktop app)*

💾 All three **save as PDF** with text you can still select and search.

Mail · Markdown

Messages and notes, read like documents

Mail (.eml)

Sender, recipients and body, with **attachments** you can save

Remote images blocked

Markdown (.md)

Headings, tables, code and task lists, typeset — with a **contents**

or open. Korean mail (EUC-KR) comes out right.

Images from the web stay hidden until you ask, so opening a message does not tell the sender.

rail that follows your reading.

Edit Markdown

Turn on the **pencil** at the bottom of the left rail to edit the source. `Ctrl` + `S` saves the .md file.

> 💡 Mail and Markdown print, search, go fullscreen, read aloud and save as PDF too. Printed and saved **as text**, so they stay sharp and selectable.

Read aloud

A natural voice, reading on your PC — no internet needed

Press the **speaker** on the left rail or `S` (or `Alt` + `S`) and the document is read from where you are, a sentence at a time. The sentence is highlighted and the view follows it.

Voice · speed

Pick one of ten voices and a speed, then **Apply** — the next sentence uses them.

Move around

`Alt` + `←` previous sentence, `Alt` + `→` next, `Alt` + `Space` pause/resume. `ESC` while reading pauses too.

Presentations

A PowerPoint deck with speaker notes is read **from its notes (the script)**. In fullscreen the slides turn as it reads.

Scanned documents

Run text recognition first, and the recognized text is what gets read.

> **The first time**, you are asked before the voice (383 MB) is downloaded. After that it works offline, and nothing you read leaves the computer. *(desktop app)*

Pages

Navigate and edit from the page list — add, delete and reorder work for PDFs and pictures

Jump to a page

Click a thumbnail in the list on the left.

Reorder

Drag thumbnails up or down. *(edit mode)*

Add pages

Insert a blank page, or pages from another PDF — or, in a picture document, **Add images**. *(edit mode)*

Delete pages

Select pages and press `Delete`. Changed your mind? `Ctrl` + `Z`. *(edit mode)*

Save selection

Select pages, **right-click** → **Save selection**, and just those pages become a new PDF. Works in view mode too.

✅ **Select several:** hold `Ctrl` or `Shift` while clicking.

💡 Stamps and signatures follow their page when pages are deleted or reordered.

🗂️ **Tabs:** opening a file while one is open puts it in a new tab. Click the tabs in the title bar, `Ctrl` + `Tab` to move on, `Ctrl` + `W` to close. Each tab keeps its own marks, undo and page.

🗜️ **Reduce file size: Reduce file size** in the save menu lowers needlessly high picture resolution and merges duplicated data (Standard, Screen, High quality) — for when a PDF is too big to e-mail.

🔏 **Digital signatures:** a signed PDF shows ✓ **signed** beside its title — click it to see whether each signature is valid and whether anything changed after it. Comments and form filling on a signed PDF are appended when saved, so its signatures stay valid. Sign yourself with a certificate file (.pfx, .p12) from **Sign** on the edit rail.

⬛ **Redact:** mark text or draw areas from **Redact** on the edit rail, or **find and mark** resident numbers, phone numbers, e-mail and card numbers at once. **Apply** removes what is under the marks from the file — not just covered. Marked pages become pictures; the rest of the text stays searchable. A file with marks not yet applied is not saved.

🆚 **Compare:** click **Compare** on the left rail and pick an earlier version (PDF, HWP, Word, PowerPoint, Markdown): additions show green, changes yellow, removals as a red bar. Click one in the list to go there; save the report as .txt.

🔗 Inserting another PDF brings its **bookmarks** under the file's name, and its **links** and **form fields** keep working. Deleting or moving pages keeps the document's own bookmarks, links and fields.

Text recognition (OCR)

Read the text in scans and photos — Korean and English

When the text is a picture, nothing can be copied or searched. Recognize it and you can select, copy, search and read it aloud. It runs **on your device**, no internet needed.

This page

Recognize this page in the **text recognition** menu on the left rail, or `R` (or `Alt` + `R`). Or click the page **four times**.

Whole document

Recognize the whole document from the same menu, or `R` twice. Progress is shown; you can cancel.

Copy a region

Hold `Ctrl` and drag over an area: just that part is recognized and **copied to the clipboard**.

Keep it in the PDF

Save as PDF afterwards and the text goes into the file, searchable in any PDF reader.

💡 A PDF that already has text needs no recognition — `Ctrl` + `F` finds it straight away.

Stamps · signatures · watermarks

Marks that stay in the file — turn on editing with the pencil at the bottom left; an edit rail opens beside it

Stamps

My stamps

Signatures

Pick a preset from the stamp button, or **upload an image** of your own. Each click on a page stamps it.

An uploaded stamp is cleaned up (white background removed, margins trimmed) and kept in **My stamps**, at the size you last gave it.

Click the signature button, draw with mouse or touch, and place it.

Watermarks

Set the text, size, colour and angle, and every page gets a translucent watermark.

📋 **The same stamp on every page:** select it, `Ctrl` + `C`, pick pages in the page list, `Ctrl` + `V` — it lands in the same spot on all of them.

↩️ **Undo:** `Ctrl` + `Z`, redo `Ctrl` + `Y`. Delete a selected stamp or signature with `Delete`. `ESC` puts the stamp tool down.

💾 Marks go into the file when you **save as PDF**. Opening another document or closing with unsaved marks asks first.

Highlights · underlines · notes (comments)

Review marks to share — they show up as comments in Acrobat and Edge too

Highlight · underline · strike

Pick a tool on the edit rail and drag across text. The tool stays on, so you can mark one passage after another.

Notes

Pick **Note** and click where it goes: a sticky note appears, ready to type in. Drag it to move it.

Comments · replies

Click a mark to open it. Write a comment, reply, mark it **Done** or change its colour.

Comment list

The **Comments** tab of the page list gathers them by page.

Search, filter open / done, and click to go there.

📥 Comments made in other apps (Acrobat, Edge…) open as they are, and you can edit or answer them.

📝 **PDF forms** show their fields in blue. Type, tick and choose straight away — no need to turn on editing — and **save as PDF** to keep the values. They print too.

✍️ **Fill & Sign:** for a paper form with no fields, pick text, ✓, ✕, ●, — or today's date from **Fill** on the edit rail and click where it goes. Drag to move; −/+ above it to resize. Sign with the **Signature** tool.

💾 **Save as PDF** writes them as real PDF comments — replies and done state included, in any PDF reader's comment list.

🙋 The name on your comments is **My name** under the Comments tab. Marks need text on the page — recognise a scan (OCR) first.

Passwords

Open locked PDFs, and lock or unlock when you save

Opening

A locked PDF asks for its password, and asks again if it was wrong.

Lock · unlock

The **padlock** at the bottom of the left rail decides what the *next save* does. It does not save by itself — **Save as PDF** carries it out.

💡 A document that arrived locked is **saved locked** unless you unlock it with the padlock first. The file name gets `_locked` or `_unlocked`.

On-screen markup

For emphasis — never saved to the file

1 Yellow highlighter

Drag to draw in translucent yellow. Press 1 again to stop.

2 Red rectangle

Drag to frame an area. Press 2 again to stop.

🖌️ **Clear all:** press ESC or the **eraser** on the left rail. In fullscreen, a second ESC leaves fullscreen.

🎯 Presenter tools

Emphasis tools in fullscreen — shown on screen only, never saved

P Pen

Draw freely by dragging.

H Highlighter

Paint over text with a thick translucent stroke.

R Rectangle

Frame the area you drag over.

A Arrow

Point at a spot with an arrow.

L Laser pointer

A red dot that follows the mouse and leaves no trace.

Z Spotlight zoom

Magnify around the mouse; the wheel sets the zoom.

Change colour and width while drawing.

1 – 5 Colour

Red · green · blue · yellow · orange.

[ ] Width

[thinner,] thicker.

Ctrl + Z · E

Remove the last stroke · erase everything.

💡 Word, mail and Markdown in fullscreen scroll a screenful at a time; + / − size the text and 0 resets it. PowerPoint opens as a slideshow.

⎋ **Two-step ESC:** with marks or a tool on, the first ESC clears them; the next leaves fullscreen.

Saving

The 💾 save menu on the left rail · Save as PDF is Ctrl+S

Every format has the same three in the save menu: **Save original file**, **Save as PDF** and **Export as EXE**. PDF, HWP and images add booklet, HTML and images.

Save original file

The file as it was opened, under another name — a deck stays .pptx, a message .eml.

Save as PDF

A PDF with your stamps, signatures, watermarks and recognized text. Word, PowerPoint, Excel, mail and Markdown become **PDFs whose text you can select**.

Save as booklet

The two-page view as a PDF, two pages per sheet — print it and fold it.

PDF · HWP · images

Save HTML

One HTML file that opens in any browser.

PDF · HWP · images

Save images

Every page as a high-resolution PNG, in a ZIP.

PDF · HWP · images

Export as EXE

A program (.exe) that carries the open document **in its own format** — the recipient just double-clicks it, nothing to install; a deck comes with its slideshow and notes. With stamps or signatures on it, it carries the PDF that includes them, and a locked PDF still asks for its password.

Desktop app (installed or portable)

> 🛟 **Autosave:** unsaved changes are kept aside every few seconds. If the app closes unexpectedly, you are offered to **recover** them next time. Saving clears the copy; password-protected PDFs are not kept. *(desktop app)*

🎬 A PowerPoint deck with notes can also be saved as a narrated video (MP4) with the **film button**. See Word · PowerPoint · Excel.

Printing

What you see — stamps, signatures and watermarks included

Click **Print** on the left rail or press `Ctrl` + `P`; a preview comes first. PowerPoint prints on slide-sized paper, Word at each page's own size, and mail and Markdown **as text**, so they stay sharp.

Keyboard shortcuts

Learn these and everything gets faster

📁 FILES · VIEW

`F1`	Open this guide
`F2`	Open a file
`Ctrl` + `S`	Save as PDF (saves the .md while editing Markdown)
`F5`	Fullscreen — from the first page
`Alt` + `F5`	Fullscreen — from the page you are on
`Ctrl` + `F`	Find
`Ctrl` + `P`	Print
`Ctrl` + `Wheel`	Zoom in / out

🖋️ EDITING

`Ctrl` + `Z` / `Ctrl` + `Y`	Undo / redo

Ctrl + C / Ctrl + X / Ctrl + V	Copy / cut / paste a stamp or signature (onto every page picked in the page list)
Delete	Delete the selected stamp, signature or pages
ESC	Put the stamp tool down

🔍 TEXT RECOGNITION · 🔊 READ ALOUD

R / Alt + R	Recognize this page
R R	Recognize the whole document
S / Alt + S	Start / stop reading aloud
Alt + ← / Alt + →	Previous / next sentence (while reading)
Alt + Space	Pause / resume (while reading)

🖍️ ON-SCREEN MARKUP

1	Yellow highlighter on / off
2	Red rectangle on / off
ESC	Clear all markup → (again) exit fullscreen

🎯 PRESENTER TOOLS (FULLSCREEN)

P / H / R / A	Pen / highlighter / rectangle / arrow (same key again turns it off)
L	Laser pointer
Z	Spotlight zoom — wheel sets the zoom
1 – 5	Colour (red · green · blue · yellow · orange)
[/]	Thinner / thicker

`Ctrl` + `Z`	Remove the last stroke
`E`	Erase everything
`C`	Slideshow captions (speaker notes) on / off
`ESC`	Pause reading aloud if it is on · otherwise clear marks → (again) exit fullscreen

🎬 MOVING IN FULLSCREEN

`→` / `↓` / `Space` / `Enter`	Next page — works with USB clickers
`←` / `↑` / `PageUp`	Previous page
`Home` / `End`	First / last page
`+` / `−`	Zoom in / out (text size for Word, mail, Markdown)
🖱️ Click the background	Next page
👆 Two-finger swipe	Previous / next page — touchpad

WZ Reader · Press `F1` anytime to reopen this guide 😊

New versions are **downloaded automatically**, and a **Restart** button appears at the top right. If you skip it, the update installs when you close the app. You can turn this off on the start screen. *(installed version)*
